Abstract: A comparative molecular study of *Aperigiillus* protease using sequence of protease gene representative 25 different *Aspergillus* species (*Aspergillus fumigatus*, *Aspergillus oryzae*, *Aspergillus flavus*, *Aspergillus novofumigatus*, *Aspergillus viridinutans*, *Aspergillus pseudotamarii*, *Aspergillus clavatus*, *Aspergillus sojae*, *Aspergillus fischeri*, *Aspergillus caelatus*, *Aspergillus novofumigatus*, *Aspergillus campestris*, *Aspergillus costaricaensis*, *Aspergillus candidus*, *Aspergillus neoniger*, *Aspergillus mulundensis*, *Aspergillus ibericus*, *Aspergillus niger*, *Aspergillus piperis*, *Aspergillus eucalypticola*, *Aspergillus vadensis*, *Aspergillus steynii*, and *Aspergillus lentulus*) have been described for several properties. To summarise the *Aspergillus* protease correlation, alignment of multiple sequence and phylogenetic tree assembly were carried out. 59 Protease gene amino acid sequence used for the constructed phylogenetic tree that showed the specific protease clusters of several species of *Aspergillus* (*Aspergillus oryzae*, *Aspergillus fumigatus*, *Aspergillus clavatus*, *Aspergillus niger*, *Aspergillus nidulans*, *Aspergillus viridinutans*, *Aspergillus flavus* and *Aspergillus fischeri*). Protease gene amino acid sequences acquired from NCBI. The homology sequence level was done using amino acid sequence. Among these proteases, the distributions of the commonly observed motifs were analysed. Protease protein sequences indicate that the structure and enzymatic function are involved.

Keywords: Protease, *Aspergillus*, Sequence, Amino Acid, Phylogenetic

Introduction

Proteases organise a wide and matrix cluster of digestive enzymes in the food, detergent and leather, medical, pharmaceutical and biotechnology industries with essential applications (Ramakrishna *et al.*, 2010). Protease enzymes are multipurpose and represent an essential variety of enzymes for the variability of their biotechnological and physiological functions (Silva *et al.*, 2011). Animals, plants and microorganisms, which constitute about 60% of the global market for enzymes, can produce those (Nirmal *et al.*, 2011). Filamentous fungi were being used for the development of different structural proteins. In particular, a few species of *Aspergillus* have been misused as essential sources of extracellular protease counting chemicals (De Castro and Sato, 2014a; Li *et al.*, 2014). *Aspergillus* produces aimed at classes for instance *Aspergillus Sojae*, *Aspergillus niger* and *Aspergillus oryzae* have approved their usage inside the food manufacturing assimilated a mostly documented as nontoxic grade as of the US medicine

management and food (Heerd *et al.*, 2012). It is possible to classify proteases as either acidic protease, impartial protease or soluble protease, corresponding to their ideal pH reactions. Proteases, especially impartial proteases, make up the world's largest amount of mechanical chemicals (Kasana *et al.*, 2011). Since their specific benefits, neutral proteases are broadly linked within the nourishment (Tavano, 2013; Yuzuki *et al.*, 2015), bolster (Zhang *et al.*, 2014), pharmaceutical (Umeadi *et al.*, 2008) and calfskin (Asker *et al.*, 2013), counting a gentle catalysis preparation and low level of contamination and high abdication. Impartial protease is often used in the food industry besides debiting soy sauce (Machida *et al.*, 2005) and brewing (Wang *et al.*, 2013). The unbiased protease, however, is largely destitute in warm solidity and is easily deactivated, limiting its application in a few companies requiring high temperatures (Xiao-Lin *et al.*, 2018). Much consideration has been given to the application of proteases to the hydrolysis of creature and plant proteins to extend their natural and useful properties. In a number of studies, antioxidant exercises

of protein hydrolysates are broadly detailed (Zhou *et al.*, 2012). Proteases hypothesized that the antioxidant characteristics of peptides come from their capacities to inactivate Responsive Oxygen Species (ROS), rummage free radicals, chelate prooxidative move metals and diminish hydroperoxides (De Castro and Sato, 2014b). Alkaline soluble proteases are particularly intrigued by their potential applications as a cleaning substance added within the cleanser industry (Anwar and Saleemuddin, 1998; Gupta *et al.*, 2002). Proteases are clustered into four robotic classes: The cysteine, serine proteases, metallo and amino corrosive proteases. Possibly the best individuals were Chymotrypsin, Trypsin, Elastase and Subtilisin. Alkaline proteases were being clustered into 20 families, categorized into 6 clans with direct ancestors, depending on their own strong interaction (Barrett, 1994). The six particular catalytic proteases sorts that can be situated documented are the threonine, serine, aspartic, cysteine, metallo-proteases and glutamic. Similarities of amino acid sequences, three-dimensional constructions and proteolytic enzymes modes of action helped decipher their evolutionary course (Nishihira and Tachikawa, 1999; Morya *et al.*, 2012). Protein sequences of developed enzymes have been described to be characterised *in silico* (Yadav *et al.*, 2009; Dubey *et al.*, 2010; Yadav *et al.*, 2010). The characterization of Silico proteases produced by the *Aspergillus* species is reported in this study. Using bioinformatics tools, multiple sequence alignment, homology search, phylogenetic tree construction and superfamily distribution were analysed. Studies of the application of new sources of proteolysis enzymes are therefore critical for advancing knowledge about bioactive proteins.

Materials and Methods

Isolation

Sequences of protease genes were selected from NCBI as raw data to differentiate among the different species of *Aspergillus* (*Aspergillus oryzae*, *Aspergillus fumigatus*, *Aspergillus clavatus*, *Aspergillus pseudotamarii*, *Aspergillus novofumigatus*, *Aspergillus viridinutans*, *Aspergillus sojae*, *Aspergillus flavus*, *Aspergillus campestris*, *Aspergillus fischeri*, *Aspergillus novofumigatus*, *Aspergillus candidus*, *Aspergillus costaricensis*, *Aspergillus mulundensis*, *Aspergillus neoniger*, *Aspergillus niger*, *Aspergillus ibericus*, *Aspergillus eucalypticola*, *Aspergillus piperis*, *Aspergillus vadensis*, *Aspergillus steynii*, *Aspergillus lentulus*, *Aspergillus fischeri* and *Aspergillus lentulus*). On the Proteomic database financial links {Clustal W, ProtParam, Protein calculator}, list of FASTA format was used for subsequent research. To determine the molecular weights of the different proteases diverse programs were used for calculation.

Detection of Restriction Site

Different program were used to detect the site of restriction enzymes (clone manger, restriction mapper)

Differentiation between Protease Genes

Statistical analyses were used to determine the differentiation between the different sp. of fungal isolates.

Results

Molecular Characterization of *Aspergillus* Protease using Nucleotide Sequences

25 different species of *Aspergillus* {*Aspergillus oryzae* (D00350.1, S79617.1, S75278.1, D10062.1, X54726.1 A. and X17561.1); *Aspergillus fumigatus* (AB807664.1, X66935.1, Z11580.1 and XM_746558.1); *Aspergillus novofumigatus* (XM_024823318.1); *Aspergillus flavus* (XM_002374250.1 and AF324246.1); *Aspergillus clavatus* (GQ925367.1 and XM_001272037.1); *Aspergillus pseudotamarii* (XM_032052352.1 and XM_032052352.1); *Aspergillus viridinutans* (AY590135.1 and AY590136.1); *Aspergillus sojae* (MG867728.1); *Aspergillus fischeri* (XM_001266851.1); *Aspergillus caelatus* (XM_032073130.1); *Aspergillus novofumigatus* (XM_024825725.1); *Aspergillus candidus* (XM_024813742.1); *Aspergillus campestris* (XM_024833434.1); *Aspergillus piperis* (XM_025662057.1); *Aspergillus mulundensis* (XM_026751684.1); *Aspergillus costaricensis* (XM_025678012.1); *Aspergillus niger* (L19059.1); *Aspergillus ibericus* (XM_025719167.1); *Aspergillus neoniger* (XM_025625888.1); *Aspergillus vadensis* (XM_025711220.1); *Aspergillus eucalypticola* (XM_025536473.1); *Aspergillus steynii* (XM_024843524.1); *Aspergillus fischeri* (XM_001258144.1); *Aspergillus lentulus* (XM_033554602.1); *Aspergillus lentulus* (XM_033555156.1)} were used. Sequences of proteases acquired from GenBank symbolise diverse species of *Aspergillus* were designated as multiple sequence alignment, homology quest, phylogenetic tree creation and superfamily quest with different bioinformatics tools. Data on gene bank reflect that *Aspergillus oryzae* was the most organism used for protease production.

PCR-Restriction Fragment Length Polymorphism (PCR-RFLP)

Protease gene analysis with the use of various restriction enzymes (StuI, AflIII, Bsp1407I, EcoP15I, PasI, SpeI, Tsp45I, BfI, KpnI, MmeI, HindII, AccI 33, AgsI, Hpy99I, TauI, BccI, CfrI, SapI, BsaBI, BtrI, MsII, PsiI, PvuII, StuI, ApoI, BclI, BglIII, Bsp1407I, BspHI, EcoRI, Esp3I, HindIII, VspI, XbaI, BtsI, Eco57I,

PfI_{MI}, Sph_I, Aat_{II}, Alo_I, Ars_I, Bsg_I, Hae_{IV}, Pst_I and Sac_{II}) were done. The digested products were fractionated in the different *Aspergillus* species (presented in Table 1). Analysis result of these genes from NCBI showed variation in restriction sites between different *Aspergillus* species. To preserve the functional activity of the protein that reflects the variation between the digested protease genes related to genes listed as presented in the supplementary file (Tables 1-36 supplementary) protease genes, maintaining the core structural component of the active site is crucial.

Molecular Characterization of *Aspergillus* Protease using Amino Acid Sequences

For comparative motif analysis, 59 of amino acid sequences of different types of *Aspergillus* species were used to detect the variation between the different sources and by it can detect the structure of protease isolated from different *Aspergillus* species. The amino acid sequences

which were collected from NCBI were classified as follows: 20 Protease gene amino acid sequences isolated from *Aspergillus fumigatus* (XP_751651.1, CAA77666.1, ACAA75805.1, EDP50543.1, XP_750914.1, 1905286A1, B0Y708.1, EAL89613.1, XP_751651.1, CAA75806.1, Q4WH48, CAA75804.1, XP_749017.1, B0Y1V8.1, P28296.2, P41748.2, EAL86979.1, B0XRV0.1, O42630.1 P0C959.1), 14 Protease gene amino acid sequences isolated from *Aspergillus oryzae* (Q2U319, Q2UDE1, Q8NK92.2, Q2UUW3, AAC60533.1, Q8NKB2, Q8NKB6.1, AAB20819.1, Q06902.2, BAA00951.1, Q9Y8E3.2, P46076.2, Q2TWA0, Q8NKB5), 9 Protease gene amino acid sequences isolated from *Aspergillus niger* (A2R3L3.1, XP_001391470.1, P55325.1, P24665.1, A2Q7V4.1, CAK44878.1, Q00070, P55325.1, A2R2G1.1), 7 Protease gene amino acid sequences isolated from *Aspergillus clavatus* (A1CIA7.1, A1CBR4.1, ACX47962.1, A1CBR4.1, EAW10612.1, EAW10612.

Table 1: Characterization of protease genes extracted from Different *Aspergillus* spp. based on (no. of nucleotides, no. of amino acids obtained after translation

Organisms	Accession no	No. of nucleotide	No of amino acid	Expected molecular weight of protein (kDa)

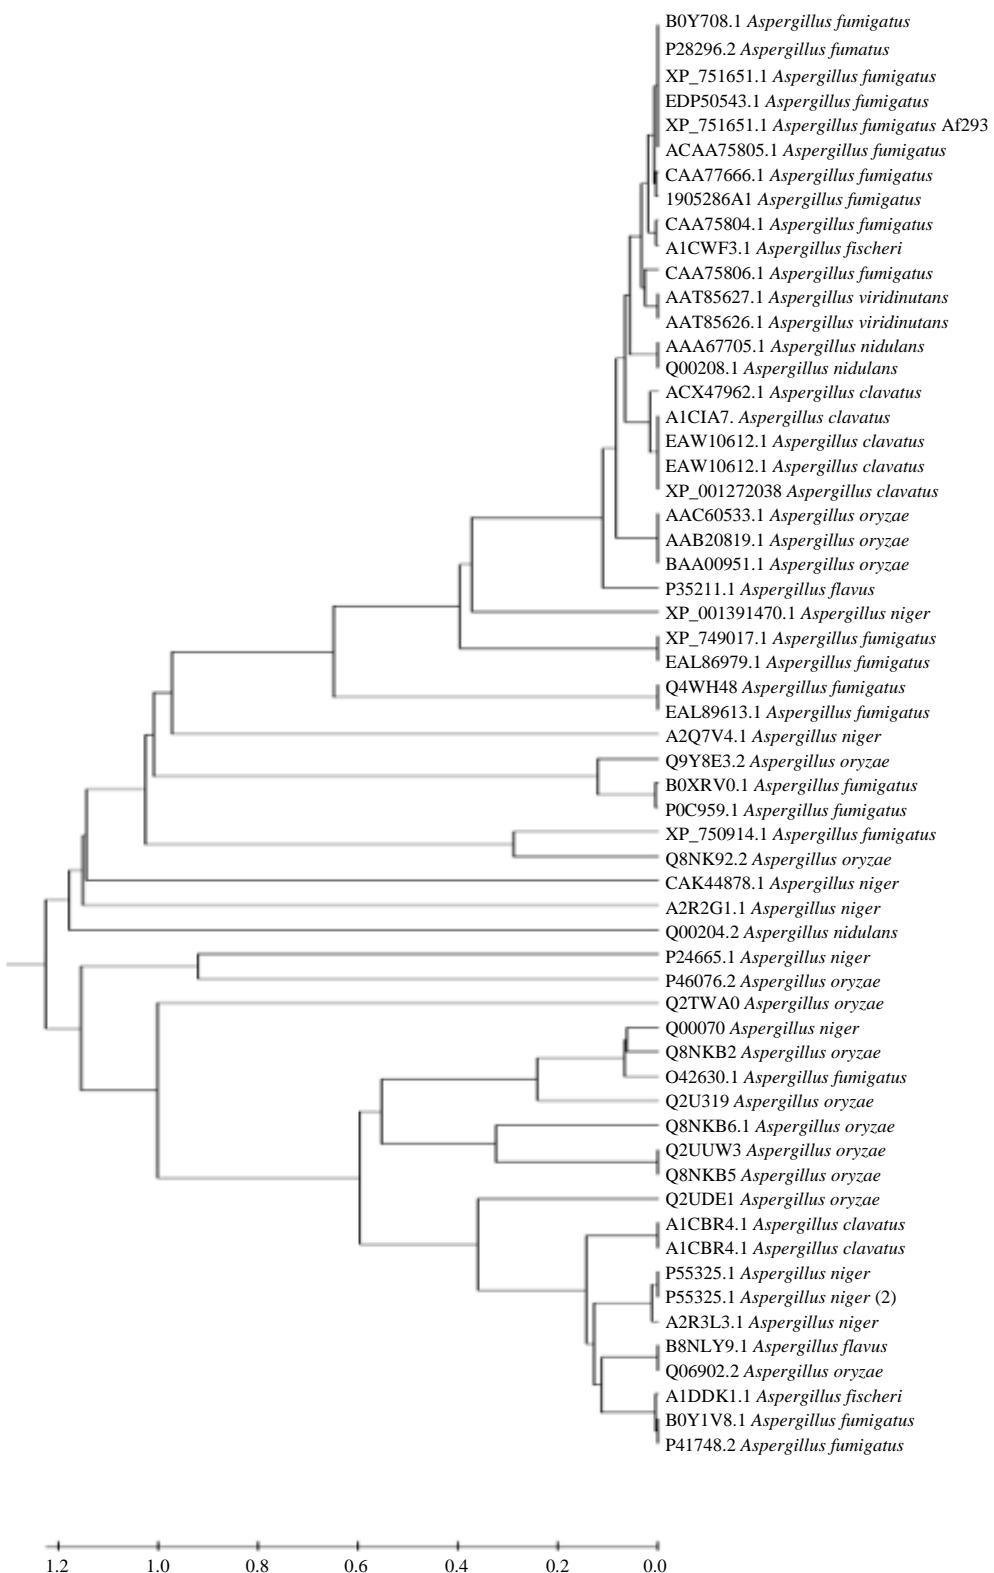

Fig. 1: Phylogenetic tree of amino acid sequence of protease gene isolated from *Aspergillus* spp. display the location amid the selected gene from NCBI based on amino acid sequence assessments

1, XP_001272038), 3 Protease gene amino acid sequences isolated from *Aspergillus nidulans* (Q00208.1, AAA67705.1, Q00204.2), 2 Protease gene amino acid sequences isolated from *Aspergillus viridinutans* (AAT85626.1, AAT85627.1), 2 Protease gene amino acid sequences isolated from *Aspergillus flavus* (B8NLY9.1, P35211.1) and 2 Protease gene amino acid sequences isolated from *Aspergillus fischeri* (A1DDK1.1, A1CWF3.1). Numbers of amino acid bases were varied (400-1030 amino acid bases) from one *Aspergillus* species to the other.

For molecular phylogenetic construction employing ClustalW, version 1.83 with ncbi database, sequence alignment orientations were performed. A phylogenetic tree was calculated for each protein based on the result of multiple sequence alignments by applying the maximum likelihood method implemented in the Mega 5 software Fig. 1. Moreover, graphic view was displayed based on comparison of some selected amino acid sequences (one of each cluster) to the target sequence protease genes from different *Aspergillus* sp. The bioinformatics examination appeared that each species of *Aspergillus* protein normal peptidase superfamily and contains particular space. It has been detailed that cuticle-degrading proteases delivered by a few nematicidal organisms have a place to the peptidase S8 superfamily 26–28. To way better get it the work and advancement of this protein, we compared the all grouping with others. Proteases from *Aspergillus* sp. are isolated into distinctive branches exceptionally clearly, which reflects their diverse sources. The protein's aliphatic index could be a calculation of the relative volume of the subsequent amino acids working by the aliphatic side sequence: Isoleucine, valine, alanine and leucine.

Discussion

The sequence and structural homology methods primarily evaluate the global similarities between proteins compared to each other (Whisstock and Lesk, 2003). However, the molecular role of a protease in general is limited to its known active site, which may involve an interaction with the binding of protein peptides. Propagations exclusive the thermal permanence of globular proteins are recognized to cover the aliphatic index (Ikai, 1980; Rawlings *et al.*, 2006). The alkaline proteases of the examined *Aspergillus* species have maintained high aliphatic guide values to be thermostable. The variability guide deals with clarity when planning a protein's in vivo half-life (Guruprasad *et al.*, 1990). Proteins with an in vivo half-life of fewer than 5 h have been described to demonstrate an guide of unpredictability of more

than 40, while those with an in vivo half-life of additional than 16 h (Rogers *et al.*, 1986) have an guide of unpredictability of less than 40. As a consequence, protein comparisons based on global sequence and structural similarity may miss proteins with active sites retained, but divergent sequences and structures may be missing (Powers *et al.*, 2006).

Conclusion

Characterization of *Aspergillus* protease protein sequences using bioinformatics programs (in silico) demonstrating the degree of similarity was remarkably found in *Aspergillus* species for sequence which could be applied for promising cloning of genes putative by designed primers from the conserved regions. Conserved motif amino acid sequence detect the secondary structures.
